WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

*** DRY air inland through Tonight ***

*** Increasing S-SW winds Shasta Valley and E of the Crest this afternoon through Thursday afternoon ***

The region is under the influence of a westerly flow pattern, and it will turn SW later today as a Pacific low pressure trough approaches. The marine layer is near 1000 ft deep and some western areas had low stratus and fog form overnight. Although coastal areas will be under the influence of cool humid marine air, very dry air will remain in inland areas through tonight. Minimum afternoon humidity will be 5-15% in many inland areas this afternoon.

S-SW winds will begin to increase later today over the higher terrain in the north as the trough approaches. With dry air still in place, a few wind-prone areas in the N and E will see afternoon gusts to 25 mph, and up to 35 mph tonight as Relative Humidity (RH) only recovers to 30-40%. This situation will be close to a High Risk event in small pockets where the winds continue at night such as Weed. On Thursday the low pressure system will reach the region and increase cloud cover, humidity and S-SW winds. Wind-prone areas will see gusts reach 40-60 mph, but with RH climbing to 30-40% by early afternoon. Widespread light to moderate rain is possible later Thursday through Friday north of a line from Clear Lake to Lake Tahoe. Areas as far south as Marin County may see some measurable rain of a few hundredths. Another low pressure system will bring rain to far NW CA on Saturday while the remainder of the region begins to dry out.

A significant warming and drying trend is expected following the trough passage late weekend and lasting into the following week. Strengthening northerly winds will be possible early next week.

SOUTHERN CALIFORNIA

***Cooling trend through Friday ***

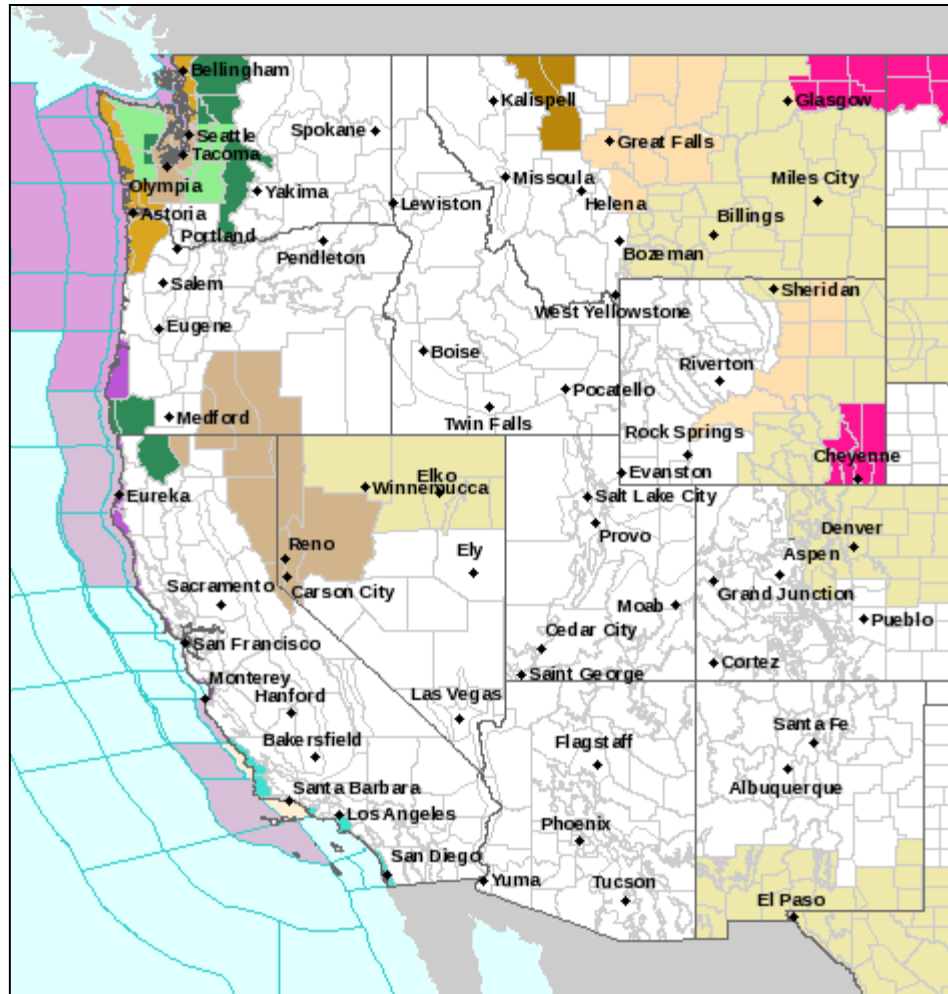

Hot, dry and breezy over the weekend into early next week

Cooler weather is expected over the next few days as a sizable trough moves into the Pacific Northwest. Onshore flow coupled with southwesterly flow aloft should allow temperatures to fall 5-8 degrees today with highs reaching the lower 70s at the coast to the lower 90s in the valleys of Southern California. RH will generally be higher this afternoon, but some single digit RH will be possible in desert-adjacent areas of the mountains. The main front associated with the trough will move inland Thursday, bringing a good chance of wetting rain for much of the northern part of the state. The trough will reach the district Thursday night into Friday. Most of the moisture will remain to our north, but light wetting rains will be possible across the Monterey Peninsula and in the Sierras from Yosemite N.P. northward. West winds of 20-30 mph with gusts to 40 mph will develop Thursday afternoon and again Friday in and near the Antelope Valley and the Banning Pass. Highs will drop to near normal readings by Friday with widespread marine layer stratus returning to the coast during the night and morning hours. The cool weather will be short-lived as a strong warming trend will begin over the weekend which will continue into the first half of next week. A strong ridge along with weak offshore flow will generate record high temperatures across much of Southern California Sunday through next Tuesday. This ridge looks to be exceptionally amplified for this time of year and the entire district should see temperatures 10-20 degrees above normal. Highs will reach the lower 90s across the valleys and lower foothills of Central California with readings over 100 over Southern California west of the mountains. Very hot weather will extend all the way to the coast as no marine layer will be present to mollify temperatures by Sunday. At this time, the offshore winds do not appear to be strong, but northeast winds of 15-25 mph will be possible Sunday and again next Tuesday. Minimum RH will fall into the single digits with poor recovery over most areas. Cooler weather may slowly return next Thursday.
